

## How to open your workspace into and install MCreator

*For further editing and adding to your mods you'll have to recreate your workspace at home - here is how!*

1. Download the Ninja's ZIP folder from the Github
2. Download MCreator from this link: <https://mcreator.net/download>
3. After downloading, run the file and follow the installation steps.
4. After it has been installed, extract your workspace zip file into a folder on your desktop, and run the MCreator workspace file present in the folder after it has been extracted
5. MCreator should start automatically loading your workspace now

## How to install your mod into Minecraft

1. Download the [name].jar file from GitHub
2. Go to <https://files.minecraftforge.net/net/minecraftforge/forge/> and find the version that your mod was created in. [Typically use 1.20.6] (You will be prompted with an ad upon clicking on download, you should click on the top right after a few seconds to skip.)
3. Run the file you downloaded and follow the steps it provides and click install client, then click OK. (If you are unable to run the file, follow the Install Java steps.)
4. Open Curseforge and open the Minecraft Menu
5. Create a Custom Profile, be sure to set the Minecraft Version to 1.20.1
6. Once the profile has been installed, hit the 3 dots and navigate to mod folder and wait for the files to open
7. Drag the .jar file into the folder titled mods then close the file window
8. Now, Ninjas should be able to launch their modded Minecraft game through the CurseForge profile. After a moment it will launch the Minecraft Launcher and at the top the option to launch with their mod should be present.
